

CreatorDocks Waitlist UX Change Summary

Date: May 29, 2026

Production URL: <https://www.creatordocks.com>

Vercel deployment: `dpl_GuMo9F7sLPT3JCuG8Y3yNkwicvxf`

Deployment URL: <https://coreloop-e44yos8pf-beachbroskis-projects.vercel.app>

What changed

- Reworked the public waitlist landing page presentation so the hero is readable on mobile and still scales cleanly on desktop.
- Added a real shared type scale for hero, section, and page headings using reusable CSS variables.
- Slimmed the sticky nav, made its background more opaque, and changed Tester sign in from a competing button into a quieter text link.
- Made eyebrow pills hug their labels instead of stretching across the full column.
- Removed the duplicate standalone dark referral incentive card. The refer 3 creators, complete 3 campaigns, earn \$25 offer now appears once inside the early access promise area and once as the form callout.
- Restyled the waitlist incentive callout from amber warning styling to a positive blue information treatment.

Waitlist form improvements

- Constrained the form to a comfortable max width so short fields no longer stretch across desktop layouts.
- Gave all text inputs and selects visible borders, white backgrounds, and a blue focus ring.
- Made the submit button full width on mobile and right aligned on desktop, with stronger weight and larger tap size.
- Confirmed the email field uses `type=email` and `autocomplete=email`.
- Added visible required indicators to Full name, Email, and Creator handle.
- Added handle input behavior for creator handles with autocorrect and capitalization disabled.
- Removed the filler line next to the submit button.

Files touched for this pass

- `app/globals.css` - shared visual tokens, type scale, nav treatment, field styling, section spacing, waitlist form utilities.
- `app/page.tsx` - public landing nav cleanup and duplicate incentive removal.
- `app/waitlist/page.tsx` - waitlist page nav cleanup.
- `app/waitlist/WaitlistForm.tsx` - form labels, input attributes, callout style, and submit row layout.
- `app/PublicPageShell.tsx` - shared public nav treatment for support/legal pages.

Verification

- npm run build passed locally.
- npm run lint passed with existing warnings only: dashboard img warnings and one pre-existing unused _children warning.
- 390px mobile check: hero headline, subhead, and primary CTA are visible without scrolling. CTA bottom measured around 505px on an 844px viewport.
- Form UI check: inputs and selects have visible borders; mobile submit is full width; desktop submit is right aligned; duplicate referral card count is zero.
- Vercel production deployment completed and was aliased to www.creatordocks.com.

Important follow-up

- The Vercel build still reports that NEXT_PUBLIC_CLERK_PUBLISHABLE_KEY is using a development Clerk instance on a production build.
- That does not block the public waitlist page from shipping, but Safari and OAuth flows can remain flaky until Vercel is updated to Clerk production keys and domain settings.
